1-3. CIRCUIT DESCRIPTION

Program Sensor

The FM or AM band can be changed automatically through the optical detection when the pointer matches to the desired station marker.

Marker Setting

1. Match the pointer to the upper marker (at FM station) or the bottom marker (at AM station) while turning TUNING knob.
2. Slide the station marker with the pointer while pushing FM switch (or AM switch) of PROGRAM in.
3. Set free the PROGRAM switch at the tuning point to the desired station.
4. The station marker is fixed in this position.

1) When the pointer matches only with the FM station marker:

- a) The light of IC402 (Photo Interrupter) is intercepted by the marker, the impedance between terminals 3 and 4 of IC402 becomes high.
- b) The base voltage of Q408 is increased through R415 and Q408 turns on.
- c) The cathode of D402 is grounded.
- d) The B+ voltage through R410 is not supplied to the terminal 23 of IC201.
- e) FM circuit operates (The terminal 23 of IC201 serves as a switch).

Note: When B+ voltage is supplied to the terminal 23, the receiver is in AM mode. When B+ voltage is not supplied, the receiver is in FM mode.

- f) The impedance between terminals 3 and 4 of IC401 becomes low. So, Q409, Q403 and Q404 turn off, Q402 turns on. Then, PL804 (FM indicator lamp) lights.
- g) The collector voltage of Q408 reduces, Q406 and Q405 turn on.
- h) The positive feedback is applied to the terminal 1 of IC402, the circuit operates correctly.
- i) Q411 is used as muting when the station marker does not match to the pointer. Namely, Q405 turns on, and Q411 turns off.

2) When the pointer matches only with the AM station marker:

- a) As the light of IC402 is not intercepted, the B+ voltage is supplied to the terminal 23 of IC201.
- b) On the other hand, the light of IC401 is inter-

cepted, Q409 and Q403 turn on. As a result, the B+ voltage is supplied to L203 (AM oscillator coil).

- c) AM circuit operates. At the same time, Q404 turns on, PL805 (AM indicator lamp) lights.
- d) The positive feedback is applied to the terminal 1 of IC401 because of Q405 operating, the circuit operates correctly.

3) When the pointer matches simultaneously with both the FM and AM station markers:

- a) As the lights of IC401 and IC402 are not intercepted simultaneously, Q408 and Q406 turn on.
- b) D405 and Q409 turn off, only the FM station signal is received.

Photo Interrupter

The terminals 1 and 2 of the photo interrupter operate as the light emitting diode. On the other hand, the terminals 3 and 4 operate as the photo detector. When the photo detector receives the light, the impedance between terminals 3 and 4 becomes low. When light is intercepted by the marker, the impedance becomes high.

Dial Scale

This scale is made up of nine bits and one common. The contact terminal on the pointer table is slid on the scale. The bits are made up of the conductor side or insulator side comparison with FM scale. The scale is indicated every 50 kHz by the combination of nine bit's conductor side. The contact terminal is slid by turning TUNING knob. When the contact terminal places on the conductor side of a bit, the bit connects to a common. Then, the output of code converter (IC503, 504) is changed to FM frequency.

When the photo detector receives the light

When light is intercepted

Fluorescence Display Tube

The fluorescence display tube is a kind of compactron. Inside of the tube forms a vacuum, the each electrode of filament, grid and plate is installed. The electron from filament moves to grid which the high voltage is always supplied, so the grid current flows.

The SIGNAL letter, the lowest level indication and the one figure number are connected to grid, so these are always lighted.

If the voltage is supplied to the plate, the electron from filament is accelerated by grid, the plate current flows.

The fluorescence paints is coated on the plate. So, the fluorescence paints light because the plate current flows when the voltage is supplied to the plate. This plate voltage is controlled by the output of IC603 (0 V or B+ voltage appears on the output), the letter on the fluorescence display tube appears.

SECTION 2 DISASSEMBLY

2-1. REMOVAL

Note: Follow the disassembly procedure in the numerical order given.

2-1. TOP COVER AND BOTTOM PLATE REMOVAL

2-2. FRONT PANEL REMOVAL

2-2. DIAL CORD STRINGING

1) Preparation

2) Stringing

Turn the tuning capacitor shaft fully clockwise and set the tuning drum so that the cutout is positioned as shown.

3) Dial Pointer Installation

1 Tune the receiver to the off-the-air signal and set the dial pointer to the frequency of the dial scale.

TA, B3 x 6

3 Install the dial pointer with a TA, B3 x 6 screw.

SECTION 3 ADJUSTMENTS

3-1. AM SECTION

Setting: FUNCTION Selector: AM
MODE Selector: MONO

- Repeat the procedures in each adjustment several times, and the frequency coverage and tracking adjustments should be finally done by the trimmer capacitors.

3-2. FM SECTION

Setting: FUNCTION Selector: FM
MODE Selector: MONO

- Repeat the procedures in each adjustment several times, and the frequency coverage and tracking adjustments should be finally done by the trimmer capacitors.

FM SECTION

FM STEREO SEPARATION ADJUSTMENT

Setup:

FUNCTION selector: FM
MODE selector: STEREO

FM Stereo Signal Generator Setting:

Carrier frequency: 98 MHz
Output level: 1 mV (60 dB)
Mode: Stereo
Modulation:
Audio (400 Hz): 67.5 kHz deviation (90%)
Pilot (19 kHz): 7.5 kHz deviation (10%)
Sub channel (38 kHz): 67.5 kHz deviation (90%)

Procedure:

FM stereo signal generator output channel	VTVM connection	VTVM reading
L-CH	L-CH	(A)
R-CH	L-CH	(B) Adjust RT301 for minimum reading.
R-CH	R-CH	(C)
L-CH	R-CH	(D) Adjust RT301 for minimum reading.

Readjust RT301 for minimum difference between left channel separation (A - B) and right channel separation (C - D).

DISCRIMINATOR ADJUSTMENT

Setup:

FUNCTION selector: FM
MODE selector: MONO

FM Signal Generator Setting:

Carrier frequency: 98 MHz
Modulation: 400 Hz, 75 kHz deviation (100%)
Output level: 1 mV (60 dB)

Procedure:

1. Secondary-Side of T201
Tune the set to 98 MHz and adjust the secondary-side core (black) of T201 for minimum reading on the distortion meter.
2. Primary-Side of T201
 - 1) Detune the set.
 - 2) Adjust the primary-side core (blue) of T201 for zero reading on the VOM.

(Perform this procedure when replacing ceramic filter (CF201)).

3. Repeat the above steps 1 and 2 several times.

76kHz test point

76 kHz ADJUSTMENT

Setup: FUNCTION selector: FM
MODE selector: STEREO

A) Regular Method

FM Signal Generator Setting:

Carrier frequency: 98 MHz
Modulation: no modulation
Output level: 1 mV (60 dB)

Procedure:

1. Tune the set to 98 MHz.
 2. Adjust RT302 for 76 kHz $\pm$ 100 Hz on the counter.
- B) Simple Method
- Procedure:
1. Tune the set to the FM stereo station signal.
 2. Turn RT302 clockwise or counterclockwise and memorize the lighting-up range of STEREO lamp.
 3. Secure RT302 at the center in lighting-up range of both turns as shown below.

FM SECTION

PLL FREQUENCY ADJUSTMENT

(This adjustment should be made after the discriminator adjustment mentioned on page 15.

Setup:

FUNCTION selector: FM
MODE selector: STEREO

FM Signal Generator Setting:

Carrier frequency: 98 MHz
Modulation: 400 Hz, 75 kHz deviation (100 %)
Output level: 1 mV (60 dB)

Procedure:

1. Tune the set to 98 MHz and adjust CT501 (AEP, UK, E Model) and CT502 for zero reading on the VOM.
2. Secondary-Side of T201
 - 1) Detune the set.
 - 2) Adjust the secondary-side core (black) of T201 for minimum reading on the distortion meter.

3. Repeat the above steps 1 and 2 several times.

Setting: FUNCTION selector: FM
MODE selector: STEREO

CT101	108 MHz	Adjust for a 22 V reading on VOM ②.
Repeat the above steps L105 and CT101 several times.		

(AEP, UK, E Model)

FM FREQUENCY DISPLAY ADJUSTMENT

Note: This adjustment should be made after FM IF adjustment.

1. Detune the set.
2. Connect the frequency counter to the emitter of Q104.
3. Solder the jumper wire to A point when the frequency is less than 10.7 MHz.
4. Solder the jumper wire to B point when the frequency is more than 10.7 MHz.
